Behzad Baladeh

Backend Engineer (Go) | Yerevan, Armenia | +374 94894475 | behzad.mousavibaladeh@gmail.com | linkedin.com/in/behzad-baladeh-129251aa/ | hidden-tools.ir

Summary

Backend engineer with 4+ years of production experience building Go services, after 5 years in software QA at an insurance software vendor and at Snapp. Experienced with high-traffic, latency-sensitive systems (NATS event consumers, PostgreSQL/MySQL, Redis), search, and observability. Based in Yerevan, Armenia, and open to remote work with European and Armenian companies, or on-site roles in Yerevan.

Technical Skills

Languages: Go, Python (test automation)
Databases & Search: PostgreSQL, MySQL, Redis, Elasticsearch, ClickHouse
Messaging: NATS, Redis Pub/Sub
Observability: Prometheus, Grafana, OpenTelemetry, Jaeger
Infrastructure & Tooling: Docker (daily use at Boomerang), Kubernetes, Helm, and ArgoCD (working knowledge from Snapp), GitLab CI/CD, Git, K6
Architecture & Practices: Clean/hexagonal architecture, REST APIs, JWT auth, unit testing, manual and automated QA

Experience

Backend Software Engineer, Boomerang (Grocery Cashback Platform)

May 2025 – Present

Built and maintained Go services backed by MySQL, Redis, Elasticsearch, and ClickHouse, deployed with Docker:

- Replaced a slow SQL `LIKE` product search with Elasticsearch (match-phrase and fuzzy queries) so searches tolerate misspelings; added a Redis cache for frequently searched phrases. This noticeably improved **search accuracy** and the accuracy of items read by OCR from invoices, **reducing manual work** for the customer support team.
- Built the backend for a client promotion campaign: 30M unique printable codes, SMS login with JWT, and a monthly lottery, at about **100 RPM**. Optimized MySQL queries with unique, single-column, and composite indexes, and set up Prometheus, Grafana, OpenTelemetry, and Jaeger for observability.
- Built the backend side of a web game that another team developed for the same campaign: **JWT sessions** for anonymous players (30-minute TTL), score updates with lottery chances when eligible, and a cron job that **expires abandoned sessions**. Found a **race condition** between the cron job and the session-result API through tracing, and fixed it with **per-row locking** and **longer query timeouts**.
- Built a survey and CRM platform for a client: surveys with multiple question types, assignment by customer ID or purchased products, and participant reports by gender and age band as tables and charts.
- Refactored existing services to **clean and hexagonal architecture**; built a proxy service that relays Telegram alerts and adapts push-notification requests to the Firebase SDK.

- Set up a **ClickHouse** instance for the data analysts' large datasets. Deployed **CH-UI** as an interactive interface for exploring the data, and connected it through **LiteLLM** to our AI agent so they can use AI in their daily work.
- Fixed customer-reported bugs, monitored service health and logs, and used AI coding assistants in daily development.

Backend Software Engineer, Snapp (Ride-hailing)

Jun 2022 – May 2025 | Driver Engagement and Retention team

Built and maintained Go services backed by PostgreSQL, Redis, and NATS, deployed with Kubernetes:

- **Driver Incentive:** Cash rewards for completing ride-count or fare targets within a time window. Consumed ride events from NATS with recovery of missed events, and served progress data, an unread-plans API polled by the client, and a latency-critical reward-amount API used by another internal service. Used a persistent Redis cluster with a **cache-aside pattern** to keep latency low.
- **Driver Rating:** Consumed passenger ratings from NATS and exposed driver score and rating-reason reports. Implemented badge rules based on a driver's last 100 ratings. Served driver score, top reasons, and badges to passengers when a ride was accepted; moving reads from the database to Redis with a cache-aside pattern, cutting response time from **70 ms to 30 ms** and database load from **12.5 to 5 QPS**.
- **Driver Performance Report:** Daily report per driver covering completed and cancelled rides, income, and rewards, using NATS events aggregated by a nightly cron job.

Software QA Engineer (Senior from Mar 2021), Snapp

Jul 2019 – Jun 2022

- Ran manual feature and regression testing for the driver applications; as senior, led a group of QA engineers and planned test cycles.
- Wrote Python API tests that sped up backend testing.
- Helped redesign the QA organization: added a QA engineering manager role and split QAs into teams led by engineering managers reporting to the QA director.

Software QA Engineer and Business Analyst, Golsoft (Insuarnce Software Conultancy)

Jan 2017 – Jun 2019

- Worked on localizing a core insurance platform built by NTT Data: translation, client-specific rules and calculations, and deployment on client servers. Manually tested premium, claim, and other business-rule calculations. Took over business analyst duties when a team BA left.

Education

M.Sc., Industrial Engineering (Financial Engineering), Amirkabir University of Technology, 2015 – 2017.

B.Sc., Industrial Engineering, Amirkabir University of Technology, 2011 – 2015.

Languages

English: Fluent (speaking and writing). PTE Academic: 90/90 overall (Listening 90/90, Reading 83/90, Speaking 90/90, Writing 88/90), taken April 2026, valid until April 2028
